Introduction

Understanding stakeholders' perceptions of our work, and our reputation more broadly, is fundamental to our objective of being known as effective, trusted regulators of Australia's registered health practitioner workforce.

The purpose of this report is to build on the work of a branding and market research company, Truly Deeply, which examined perceptions of the National Registration and Accreditation Scheme (the National Scheme), the Australian Health Practitioner Regulation Agency (Ahpra), and the National Boards (the Boards) from 2018–2020.

Ahpra's Research and Evaluation team took responsibility for this work in 2021, with the aim of increasing the breadth and depth of this research to generate more nuanced reputational insights to benefit Ahpra and the Boards. As a more robust research scope is currently being developed, including a five-year plan to elicit extensive reputational insights, the 2021 study took an interim approach based on the survey administered by Truly Deeply. This work analysed survey results from a random sample of registered health practitioners, reported key findings with reference to previous years, and identified areas of interest for future research.

A principal report encompassing all the registered professions has previously been provided to Ahpra and the Boards. This supplementary report presents findings relevant to the Chinese Medicine Board of Australia (the Chinese Medicine Board).

Overview of methods

We collected data from practitioners using a replica of the Truly Deeply survey. A random sample of 138,453 health practitioners from the 16 regulated health professions were emailed the survey between 15–28 November 2021. When forming the sample, we aimed to replicate the number of practitioners in each profession as were included in the 2020 sample, to help with comparison between years.

The survey results were analysed descriptively to summarise findings, and we used statistical tests to infer significance of results where appropriate. To keep findings comparable, we treated the data similarly and conducted the same statistical tests as Truly Deeply, wherever possible. As such, we applied chi-square tests of independence and chi-square tests for trend (also known as Cochran-Armitage tests) where relevant to identify statistically significant differences in responses between groups, such as between genders, age groups, and practitioner groups. Due to limitations implicit to previous years' data, we were unable to conduct statistical testing between years.

The survey also generated qualitative data in the form of thousands of free text responses. To analyse free text we used topic modelling, a machine learning technique that scans text to detect word or phrase patterns, then clusters similar words or expressions to characterise a dataset. Topic modelling reveals latent topics within the data, enabling us to better understand the content of participants' responses and infer important commonalities. We applied this process to explore questions about trust in Ahpra and the National Boards.

Figure 1 (see next page) describes this process in greater detail.

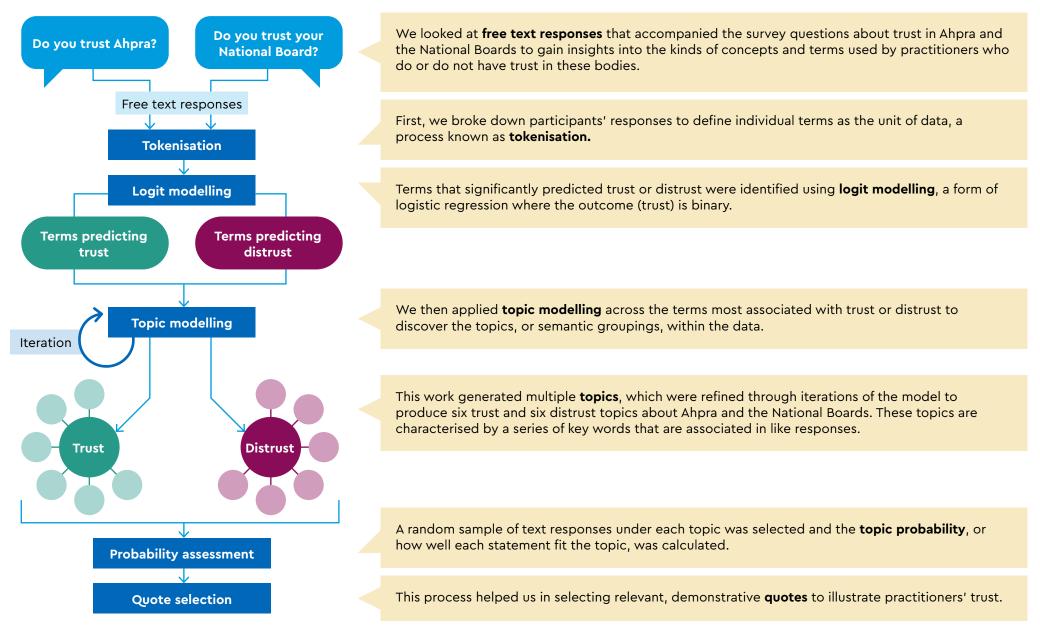

Notes on figures

In this report, dots next to column graphs are used to indicate highest (\bullet) and lowest (\bullet) values mentioned in the commentary.

Due to rounding, some values may not add up to 100%.

Statistically significant results of note are discussed in the accompanying commentary.

Fig 1. Topic modelling

Survey findings

Reputation insights 2021: Practitioner perceptions of Ahpra and the National Boards - Supplementary report prepared for the Chinese Medicine Board of Australia

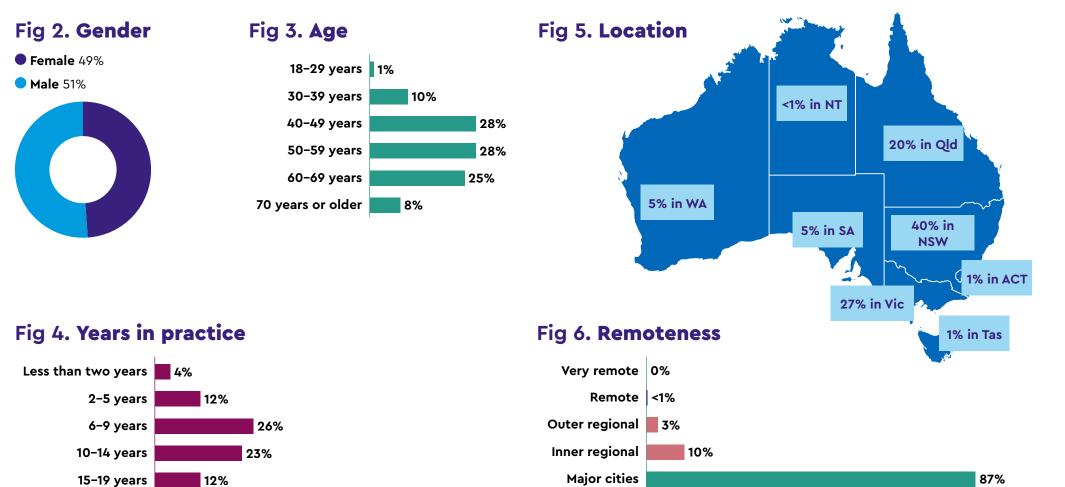

Sample demographics

20 years or more

A total of 638 Chinese medicine practitioners registered with the Chinese Medicine Board responded to the survey. Roughly half of respondents were female, most were aged between 40 and 70, and the majority had been practising for six to nine years, though many also reported practising for 20 years or more.

The majority of respondents were working in a major city, and were in the populous eastern states, particularly New South Wales.

23%

Sample demographics

About half of respondents primarily spoke English at home, though over half were born overseas, and less than 1% of the sample identified as Aboriginal and/or Torres Strait Islander.

Just under 5% of Chinese medicine practitioners reported being the subject of a complaint, and nearly a third reported having been audited for compliance.

Fig 7. Aboriginal and/or Torres Strait Islander

Fig 9. Languages spoken

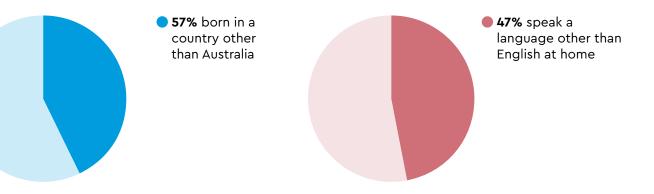

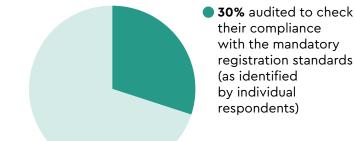

Fig 10. Subject of complaint

4% have had a complaint about them made to Ahpra or their National Board (as identified by individual respondents)

Fig 11. Audited

Practitioner perceptions

Practitioner perceptions of the Board

Awareness of the Chinese Medicine Board remains very high, with 99% of Chinese medicine practitioners surveyed reporting awareness in 2021. These levels have been largely sustained over the course of the surveys.

Interest in the role and function of the Chinese Medicine Board declined 8% from 2020 to 78% in 2021, the lowest level recorded to date. Chinese medicine practitioners reported marginally higher interest in their National Board compared to other practitioner groups.

Fig 12. Overall awareness year-on-year

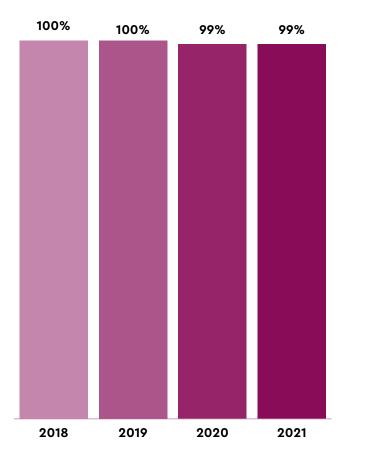

Fig 13. Overall interest year-on-year

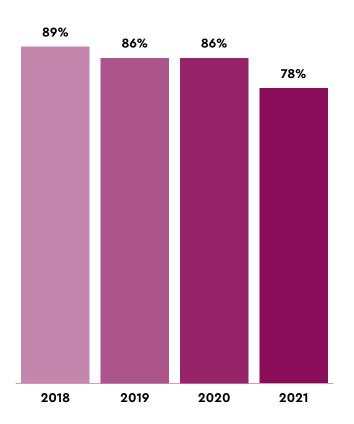

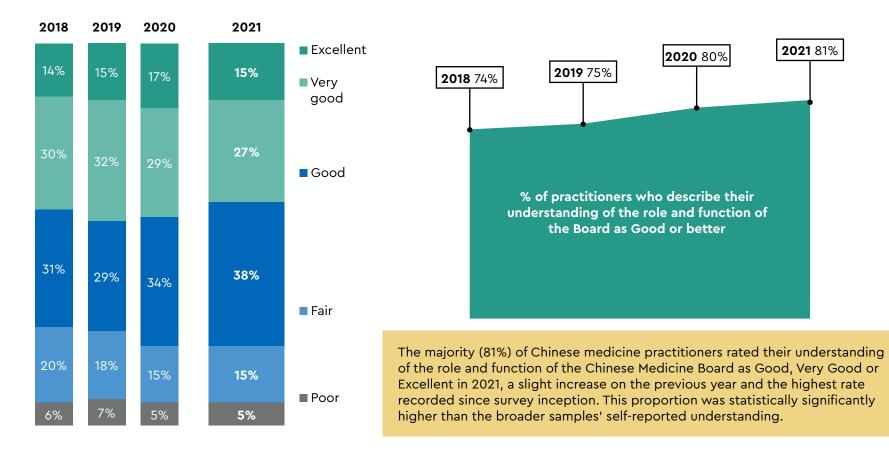

Fig 14. Overall understanding of the role and function the Board year-on-year

Practitioner perceptions of the Board

Most (60%) respondents viewed the Chinese Medicine Board in a positive light, a 7% increase from 2020. Chinese medicine practitioners perceived the Chinese Medicine Board significantly more positively compared to sentiments towards Boards on average.

Only 54% of respondents indicated that they had trust in the Chinese Medicine Board. Though this means nearly half of respondents stated that they did not trust the Board, this rate has been increasing throughout the surveys and was marginally higher than average trust in Boards overall.

Confidence in the Chinese Medicine Board increased more substantially to 61% in 2021. In this case, the rate of confidence was significantly higher than that reported by other practitioner groups.

Fig 15. Perceptions year-on-year

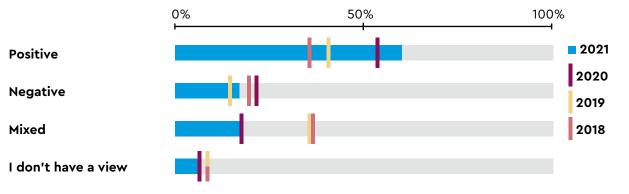

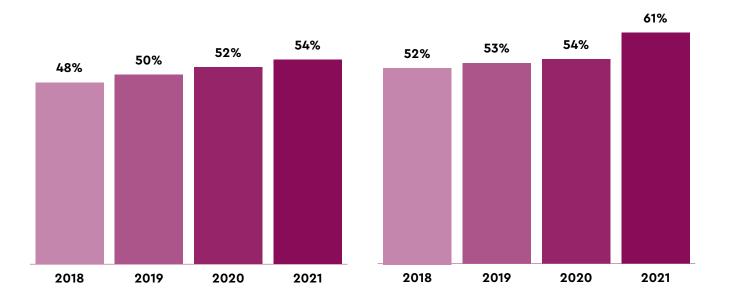

Fig 16. Trust year-on-year

Fig 17. Confidence year-on-year

Practitioner perspective of support received

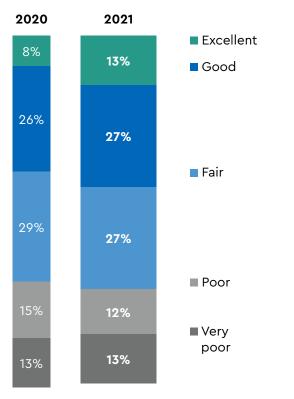

Practitioners were asked to rate the level of support they received from Ahpra and the National Boards to maintain or improve their professional practice.

When combined, 40% of Chinese medicine practitioners rated the support received favourably (Good or Excellent), 27% rated the support received as Fair, and 25% rated the support received negatively (Poor or Very poor). The remaining 8% selected 'I don't know'.

These values are very similar to data collected in 2020, though minimal changes were visible in the form of a small increase of respondents rating support received as Excellent (+5%), and small decreases in respondents rating their support received as Fair or Poor (-2% and -3% respectively).

Chinese medicine practitioners were statistically slightly more likely to rate the support they received positively than the other practitioner groups in the sample.

Fig 18. Practitioners' assessment of support to maintain their professional practice

Word associations

Truly Deeply created a list of terms to explore stakeholders' word associations with Ahpra and the National Boards as part of its branding research.

Chinese medicine practitioners associated the Chinese Medicine Board with terms like:

- 1. Regulators (40%)
- 2. For the public (33%)
- 3. Administrators (30%)

The terms least commonly associated with the Chinese Medicine Board were:

- 1. Nurturing (2%)
- 2. Zealous (2%)
- 3. Submissive (3%)

When asked which traits they associated with their profession, Chinese medicine practitioners chose:

- 1. Professional (48%)
- 2. Knowledgeable (34%)
- 3. Caring (29%)

Fig 19. Word associations with the Board

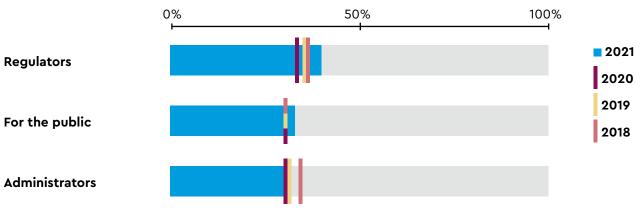

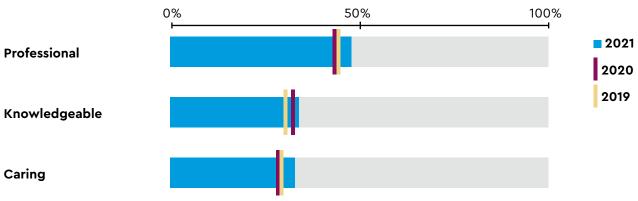

Fig 20. Word associations with practitioners

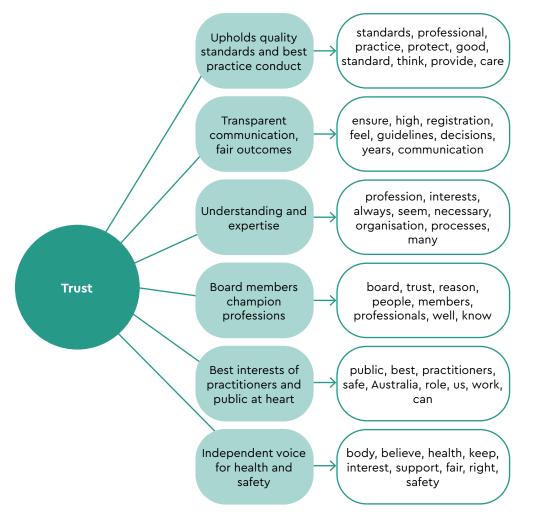

Modelling practitioner trust

Modelling trust

The topic modelling produced six topics relating to trust in the National Boards across all professions. Topics, key words and quotes are shown below.

Fig 21. Trust in National Boards

Note: key words referring to specific professions/practitioners have been removed for publication

Trust in the Board

Generally, respondents with trust in their National Board referenced organisational characteristics in topics including Upholds quality standards and best practice conduct, and Best interests of practitioners and public at heart. Trusting responses also clustered under Transparent communication, fair outcomes. Three topics related to practitioners' positive views of Board members, and those members' intimate knowledge of their respective professions: Understanding and expertise, Board members champion professionals and Independent voice for health and safety.

Examples of Chinese medicine practitioner quotes related to trust include:

'The ethos of the CMBA: to help both the public and the practitioner.'

'Responsive to the critical issues relevant to the Chinese medicine profession.'

'[They] seem to be active when needed to protect the public.'

"The only organisation we could trust as a Chinese medicine practitioner in Australia."

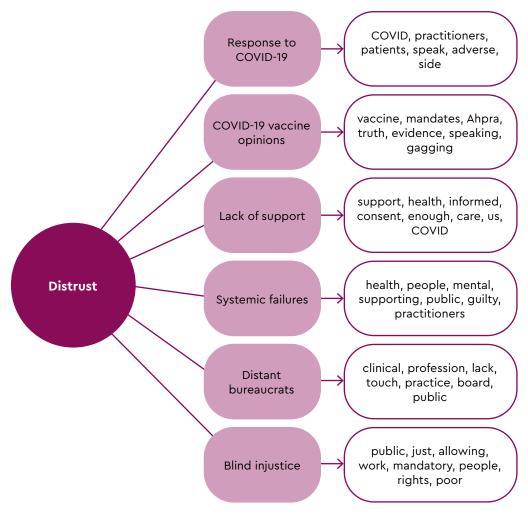

'Because most member[s] of [the] Chinese Medicine Board have [a] very good education background.'

'From the communication via email and the speech at the association events, the team seems to be responsive and knowledgeable.'

Modelling distrust

The topic modelling produced six topics relating to distrust in the National Boards across all professions. Topics, key words and quotes are shown below.

Fig 22. Distrust of National Boards

Note: key words referring to specific professions/practitioners have been removed for publication

Distrust of the Board

Distrust was undercut by opinions relating to COVID-19, vaccination, and vaccine mandates. Statements referring to these issues suffused the data and were clustered under *Response to COVID-19*, which referred to Ahpra and the Boards' decisions around registration and vaccination in particular, and *COVID-19 vaccine opinions*, which more specifically referred to practitioners' sentiments against vaccination.

Beyond COVID-related concerns, the view that practitioners are treated unfairly by Boards appeared under *Blind injustice*. Practitioners who lacked trust in their Boards also raised a *Lack of support* overall for their profession and *Systemic failures*, especially in mental health. Both these topics are relatable to a perception of Board members as *Distant bureaucrats* who have lost connection with those 'at the coal face'.

Examples of Chinese medicine practitioner quotes related to distrust include:

'[They] don't effectively represent the profession, protect the public or the practitioners, therefore fail their mandate.'

- 'CMBA are academic bureaucrats without an understanding of the practicalities of running a real-world clinic ...'
- 'They're out of touch with the profession. They're not benefitting practitioners and not fighting for our wants or needs.'
- 'They have provided zero support/communication in my time being registered.'

'They facilitate the gagging of practitioners from speaking about the benefits of our medicine.'

Whole sample trends (practitioners across all professions)

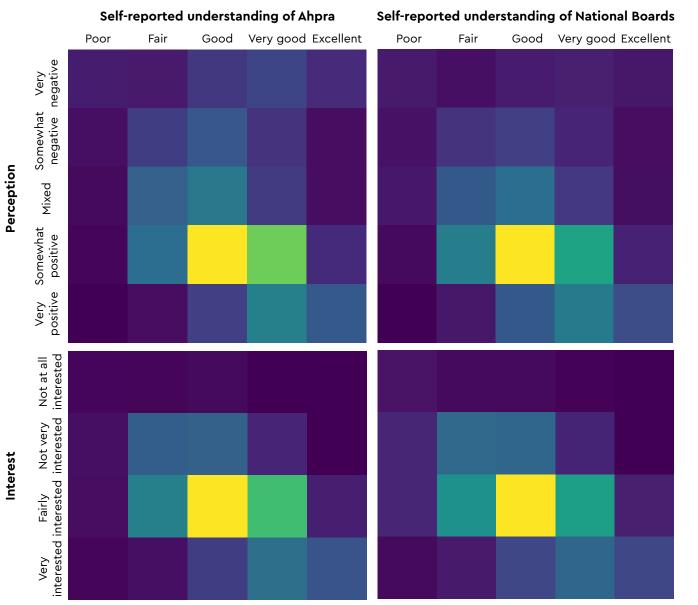

We observed several trends in the total practitioner sample that generally held true across professions.

In addition, some findings remain largely unchanged from previous years' surveys so have not been explored beyond the total sample level.

These are reproduced from the principal report in this section.

Link between understanding and sentiment

Fig 23. Understanding of Ahpra and National Boards and sentiment

We found a statistically significant relationship between practitioners' self-rated understanding and their sentiments toward Ahpra and the National Boards. This factor impacted multiple elements of perception for each body: practitioners who rated their understanding of Ahpra and the Boards highly were more likely to have positive views of the organisation in addition to greater trust, confidence, and interest in, the organisation.

In contrast, those practitioners who rated their understanding lower on the scale were more likely to exhibit negative or mixed sentiments, as well as select options like 'I don't know' or 'I prefer not to answer'.

To illustrate this relationship, these heat maps show the distribution of practitioners' understanding and sentiment towards their National Board, using colour to delineate concentration of responses (i.e. lighter colour represents more responses).

We can see that those who report greater understanding tend to also show more positive perceptions of the Boards.

2,500 - 2,000 - 1,500 - 1,000 - - 500

Influence of age and gender

We found evidence that gender and age influenced awareness and understanding of Ahpra, the National Scheme, and the Boards.

Where results were statistically significant, the trend was that older, male respondents were more likely to self-report higher awareness and understanding than their younger, female counterparts.

This included findings that awareness of the National Scheme was 11% higher in male respondents, and that the oldest (70 years and older) practitioners nearly twice as frequently reported awareness of Ahpra compared to the youngest (18–29).

However, this trend was not visible across all awareness and understanding questions: for example, while understanding of National Board role and functions did vary significantly by age and gender, we found no significant differences between these categories in understanding of Ahpra's role and function.

Similarly, awareness of Ahpra and National Boards was significantly impacted by age but not by gender.

Because the age/gender trend was not consistent across the awareness and understanding questions, we cannot draw strong conclusions based on the results of this study.

However, it could be useful to explore this trend further as it may have implications for practitioner engagement and allow us to more effectively direct communication with practitioners in future.

Practitioner perspectives of engagement

National Scheme report

Several initiatives were implemented by Ahpra and the National Boards in 2021, largely in response to changing sector needs triggered by the COVID-19 pandemic.

Some practitioners were directly affected or involved with these initiatives, and some practitioners were not. It was not clear whether practitioners who were not affected, or less affected, had any knowledge of these initiatives.

The survey results showed some awareness of the new initiatives, though one quarter of respondents stated they were unaware of any of the initiatives.

Overall, practitioners were most likely to have been aware of COVID-19 vaccination and practice guidance (45%), but also knew of flexibility in continuing professional development (CPD) requirements (41%) and the pandemic response sub-register (39%) to support a COVID-19 surge health workforce.

Practitioner groups with significantly higher proportions of respondents who indicated no awareness of the new initiatives included paramedics, medical radiation practitioners, and medical practitioners.

Fig 24. Practitioner awareness of new initiatives in response to COVID-19

• 25% were not aware of any of these initiatives

 45% were aware of guidance regarding vaccination and practice

 41% were aware of flexibility on meeting continuing professional development requirements

 39% were aware of temporary registration on a sub-register of over 50,000 practitioners to help with pandemic response

 19% were aware of flexibility on clinical experience requirements for affected students

Fig 25. Proportion of practitioners reporting no awareness of new intiatives

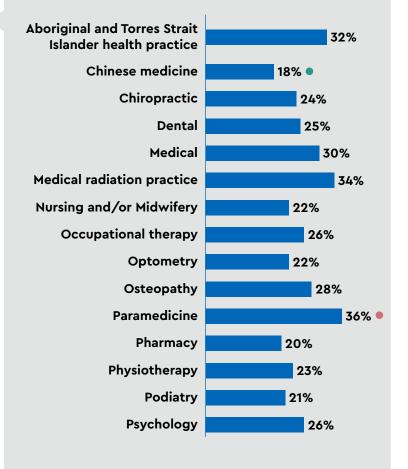

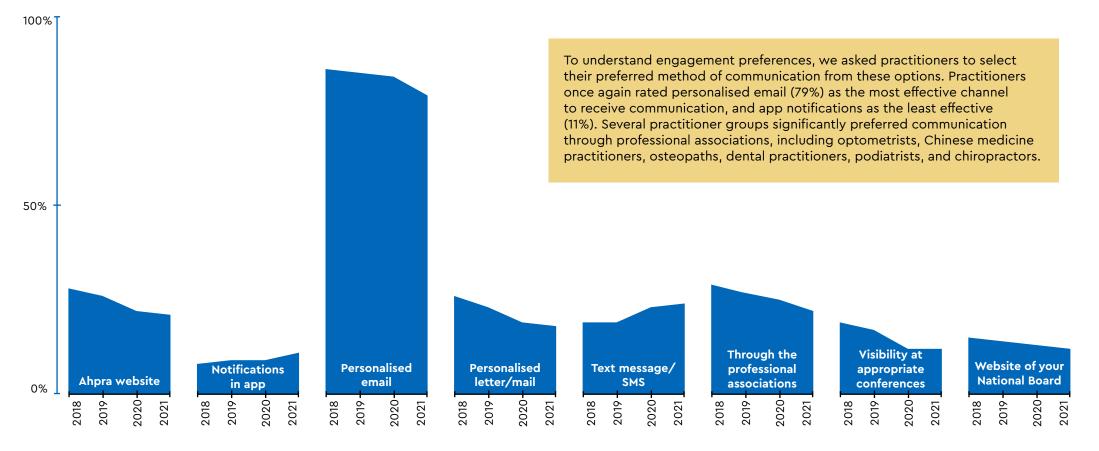

Fig 26. Most effective channels for engagement

Practitioners' use of Ahpra website

Practitioner responses suggest that the Ahpra website may have become more user-friendly, with data showing only 7% of respondents described finding information as 'difficult', a decrease compared to 2020. Similarly, only 5% of respondents said that they had been unable to find the information they were looking for on the website. Respondents were most likely to be accessing the website annually or less often, and were overwhelmingly visiting to renew their registration.

Fig 27. Frequency visiting the Ahpra website

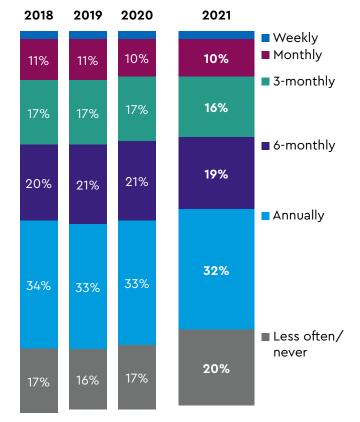

Fig 28. Main reasons for visiting the Ahpra website

Fig 29. Finding information on the Ahpra website

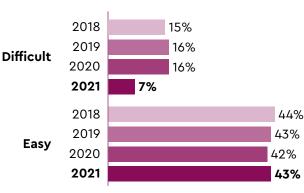

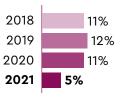

Fig 30. Practitioners who could not find specific information on the Ahpra website

Practitioners' use of National Board websites

The same was generally true for National Board websites, with the majority of respondents visiting to renew registration (53%), read a policy, code or guideline (26%) or access the public register (20%).

The frequency of visiting National Board websites was slightly lower than the Ahpra website, with 22% of practitioners stating they visited annually but 31% stating they visited less often than this or never. However, most respondents (36%) also said it was easy to find the information they were looking for.

Fig 31. Frequency visiting a National Board website

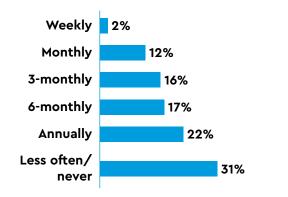

Fig 32. Finding information on a National Board website

Practitioner perceptions of communication

In terms of communication from Ahpra, survey respondents were overall content with the current frequency (75%), though 19% were interested in more frequent communication. Most respondents considered communication from Ahpra 'moderately important' (48%) or 'very important' (40%).

This is generally aligned with previous years' survey results, however, the proportion of respondents who view Ahpra communication as 'very important' and would typically read it immediately has decreased from 2018-2021.

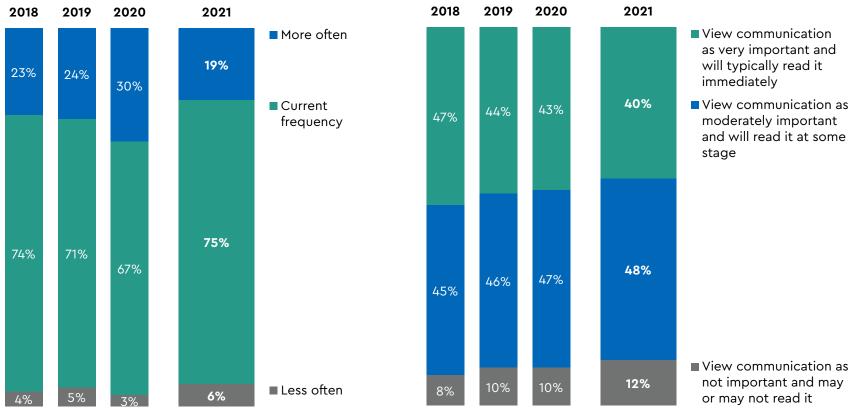

Fig 34. Preferred frequency ofFig 35. Typical response to Ahpracommunication from Ahpracommunication

Practitioner perceptions of communication

About a quarter of respondents (26%) wanted more frequent communication from their National Boards, but the majority (68%) were content with the current frequency.

Respondents appeared to view communication from their National Board as potentially less important than that from Ahpra – while the majority (49%) still considered Board communication 'moderately important', only 35% viewed it as 'very important' and 16% said they wouldn't treat it with any particular importance, a 4% increase on previous years' findings.

Fig 36. Preferred frequency of communication from National Boards

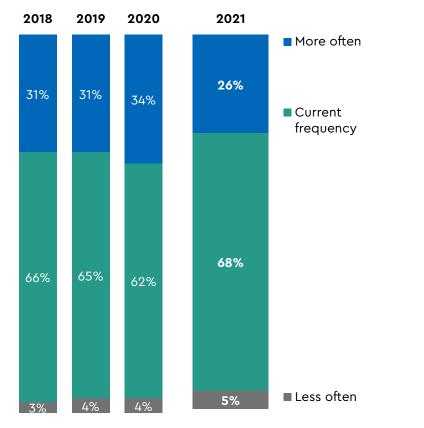

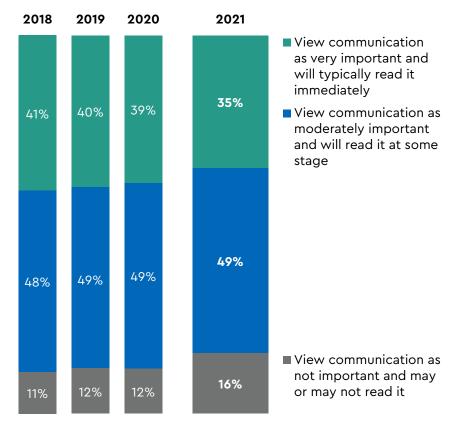

Fig 37. Typical response to National Board communication

The following practitioners were significantly more likely to be interested in more communication from both Ahpra and their Board:

- optometrists
- Chinese medicine practitioners
- osteopaths
- dental practitioners
- podiatrists, and
- chiropractors.
